

**CONSENT TO PERFORM EXCIMER 308-NM  
ULTRAVIOLET B (UVB) LASER PHOTOTHERAPY**

PATIENT: \_\_\_\_\_

DATE: \_\_\_\_\_

**PURPOSE**

UVB (ultraviolet B light) is the most common form of phototherapy used to treat various skin diseases including psoriasis, vitiligo, eczema, itching, and disorders including striae alba and hypopigmented scars. 308-nm Laser Phototherapy is an advanced form of UVB phototherapy that delivers targeted, high-dose, monochromatic therapeutic light directly to affected tissue without exposing healthy skin.

**PROCEDURE**

The 308-nm Phototherapy Laser creates a concentrated, but painless, beam of light that is applied through a handpiece directly to the skin. By targeting only the affected tissue, the laser delivers high-dose treatment that may promote faster clearing and longer remission than conventional UVB phototherapy. Treatment is done twice a week. Usually a minimum 8-10 treatments for improvement depending on individual response, thickness and severity of disease.

**RISKS/DISCOMFORT**

The most common side effect of this therapy is UVB-induced sunburn, which tends to be mild and short-lived. This may occur at any time during therapy. Certain drugs may also cause you to get sunburnt. Please let your doctor/nurse know of any medications you are taking, or any that you begin while undergoing therapy. If sunburns occur, antibiotic ointment or aloe vera gel may be used after treatment.

Other possible but rare side effects include blistering and hyperpigmentation, which tend to be mild and short-lived. If blistering occurs, antibiotic ointment or aloe vera may be used after treatment.

It is possible with any form of UV light that an increased incident of skin cancer may occur later in some patients, usually only with many UV light treatments over extended areas of skin. The targeted nature of 308-nm UVB laser phototherapy, short treatment time, and the low number of treatments may reduce this risk.

UV treatments may cause dryness and itching.

UV treatments age the skin over time and may increase freckles and pigmentation of the skin. The targeted nature of 308-nm UVB laser phototherapy, short treatment time, and low number of treatments may reduce this risk.

Ultraviolet rays may damage the eyes and increase your risk of cataracts. This is preventable with protective eye goggles worn during treatment. These will be given to you and are required for treatment.

UV light may cause exacerbation of other medical conditions such as lupus erythematosus that have sensitivity to UV wavelength.

**QUESTIONS**

A member of the Center for Dermatology & Skin Cancer staff has explained the nature of the procedure and its alternative treatments, and the benefits to be reasonably expected compared with alternative approaches and your questions were answered. If you have any other questions about this procedure, you may call us at (630) 964-2000. This document is written confirmation of this discussion.

**CONSENT**

You have read this form and understand it. You request the performance of the procedure(s) described above. You have been given a copy of this consent form. Your consent and authorization for this procedure is strictly voluntary. By signing this informed consent form, you hereby grant authority to perform UVB Laser Phototherapy treatment.

The nature and purpose of this procedure, with possible complications, have been fully explained to your satisfaction. No guarantee has been given by anyone as to the results that may be obtained by this treatment.

I agree to have photographs taken for documentation as well as teaching and research purposes, as well as for possible use in publications.

I have read the consent and certify that I understand its contents in full. I have had enough time to consider the information and feel that I am sufficiently advised to consent to this procedure. I hereby give my consent to this procedure and have been asked to sign this form after my discussion with Center for Dermatology & Skin Cancer staff.
